Digital Products -

BASELINE REPORT AND DEMAND MAP

April 2026

IT Business Solutions Delivery

NTT DATA

INTRODUCTION
OBJECTIVES OF THE DOCUMENT

Avangrid is consolidating Customer Services Applications and IT Business Applications into a single Digital Products organization — demand fragmentation is the structural risk the Target Operating Model must resolve.

PROJECT SCOPE

- **Digital Products in scope**: IT Business Applications (4 teams, ~26 FTE) and Customer Services Apps (5 teams, ~24 FTE, 2 Sr. Manager vacancies).
- **Five end-to-end stages assessed per team**: Intake → Classification → Prioritization → Portfolio → Delivery.
- **Baseline** grounded in interview evidence and RFI data received from the teams.
- **Wave 1 delivers**: Baseline Report, Demand Map, Portfolio Landscape, Lifecycle v1.0, Jira Config v1.0, and a live BRS pilot.

OBJECTIVES OF THIS DOCUMENT

- Provide **context and establish the foundation** of the project, including a **structured methodology** to guide **phases, activities, and deliverables**
- Analyze the **current state of Digital Products**, covering **roles and responsibilities, value streams, tools, and governance**
- Assess the **project portfolio landscape,** including **demand, tools, capabilities, and alignment** with strategic priorities
- Synthesize **key insights and define the foundations for the Target Operating Model** that will shape **future ways of working**

CONTEXT
WHY WE'RE HERE

Avangrid is consolidating Customer Services Applications and IT Business Applications into a single Digital Products area — IT Business Solutions Deliver; demand fragmentation is the structural risk the Target Operating Model must resolve.

WHY WE ARE HERE

Digital Products is being re-founded under VP Vitor Cruz as a new department, **consolidating IT Business Applications and Customer Services Applications** into a single ~50-FTE organization to **improve alignment, efficiency, and cross-team collaboration**.

The teams is expected to grow by 30–50% across SAP and IT Applications department, risking a l**ack of a unified intake, classification**, and **prioritization model**, which leads to **inconsistent handling** of requests and limited alignment with business priorities.

The **delivery model remains fragmented**, operating across a **disconnected ecosystem with unclear roles, inconsistent tools, and limited reporting**, reducing the organization's ability to effectively guide execution and monitor performance.

THE CHALLENGE

No Operational Transparency
Inability to effectively manage capacity or predict delivery timelines for the projected 30-50% growth.

No Standardized Value Criteria
Resources may be allocated to low-value initiatives while strategic priorities face delays.

Operational Fragmentation
High operational overhead, data inconsistency, and increased risk of requirements getting lost in translation.

Digital Products is defining its future ways of working to tackle gaps in transparency, prioritization, and delivery. The objective is to build a scalable, aligned and value-driven operating model.

© 2026 NTT DATA, Inc.

CONTEXT
WHY WE'RE HERE

Digital Products is scaling rapidly, but lack of a unified operating model is creating fragmentation and inefficiencies; We address this by defining a structured, end-to-end model across strategy, execution, governance and tooling

OUR RESPONSE — 4 DIMENSIONS

Lifecycle & Strategy
One intake → Value Based Prioritization → E2E traceability

Tools & Transparency
Jira workflows → PPMNow visibility → Real-time dashboards

People & Governance
RACI across lifecycle → Champions per area → Governance model

Pilot & Adoption
BRS pilot → OwnIT Playbook → Validated for Wave 2

FUTURE STATE (WHAT WE AIM TO ACHIEVE)

- ✓ Single structured intake process for all demand types
- ✓ Product-focused lifecycle process to standardize operations
- ✓ Value-based framework
- ✓ Structured analysis phase & capacity-aware assignment
- ✓ Standardized workflows (Jira) across Digital Products
- ✓ Automated dashboards from single source of truth
- ✓ Integrated Ecosystem Design (Intake + Jira + PPMNow)
- ✓ Defined RACI per lifecycle phase

We will accelerate delivery and reduce risk by leveraging proven capabilities from four existing Avangrid projects across these dimensions

STEP 1 — ENABLEMENT · ZOOM IN

WHAT WE DID

Prior Materials Review

Reviewed 40+ prior artifacts: IT CS Operating Model, P&S Playbook, DTO NextGen, Org Chart, Competency Framework.

Stakeholder Interviews

Champion interviews (GIS, Corporate, G&E, Global SAP, Smart Metering and SAP) and Senior Management sessions (VP – IT Business Solutions Delivery, Dir. Customer Service Products, Dir. Customer Services Apps, and Dir, IT Business Applications). Captured intake channels, tools, roles, pain points and aspirations per team.

Demand & Portfolio Interviews

Mapped demand typology per team across the 5 lifecycle stages — volume mix (incidents · small/medium · large projects), channel split, portfolio inventory

Capacity & Reporting

Captured capacity baseline per area. Reviewed current reporting cadence and identified data gaps against a single source of truth for KPI dashboards.

DELIVERABLES OF STEP 1

- Baseline Report (this deck)
  - Demand Map
  - Project Portfolio Landscape

© 2026 NTT DATA, Inc.

EXECUTIVE SUMMARY
GENERAL FINDINGS

Digital Products runs nine sub-teams on six disconnected intake channels — with no shared prioritization logic, and knowledge concentrated in named individuals across every single team

GOVERNING THOUGHT — Fragmentation is structural, not local — across flow AND capacity. Every team has a working answer for large PDD-funded demand; no team has one for small/medium demand at scale, none has formal capacity planning, and knowledge is concentrated in named individuals. The Target Operating Model must standardize the end-to-end lifecycle AND install capacity and reporting discipline across both branches.

01 INTAKE & CLASSIFICATION

FINDING

6+ channels active (Jira, IT Now, RITM, SharePoint, Email, Word). Only G&E operates with a structured intake — quarterly Big Room Planning + PBB Canvas; Corporate still uses Word for requirements.

SO WHAT?

No single front door across Digital Products. Volumes and duplicates are invisible, except where the P&T model is already in place.

02 PRIORITIZATION & PORTFOLIO

FINDING

Each team applies a different logic — PDD, impact × users, criticality, or intrinsic common sense. G&E uses Portfolio Estimation Logic (formula-based scoring)

SO WHAT?

Capacity cannot be reconciled across the branch. Strategic work loses to incident volume.

03 ORGANIZATION & DELIVERY

FINDING

Two Sr. Manager vacancies in Customer Services (CRM & Contact Center Ops, SAP & CS Architecture). Delivery leans heavily on SWF + vendor muscle.

SO WHAT?

Leadership gap + vendor concentration create structural risk for scaling.

04 CAPACITY & REPORTING

FINDING

No formal capacity planning across Digital Products. Knowledge concentrated in named individuals in every team. Two teams self-describe as KPI-less; only Global SAP has a single KPI (incident count). G&E is the only area with portfolio-level KPIs in place today.

SO WHAT?

Can't measure delivery performance or reconcile demand vs capacity. Key-person risk is the single most repeated finding across the canvases.

The rest of this deck walks the evidence per team — then consolidates bottlenecks and structural insights into the Target Operating Model scope

© 2026 NTT DATA, Inc.

EXECUTIVE SUMMARY

VALUE STREAM MAPPING - DEMAND FLOW

NTT DATA

Across both IT Business Applications and Customer Service Applications, only 1 area already operate at scale — G&E , the rest still run 6+ disconnected channels

	SOURCE Who sends the demand	TYPES What kind of demand	01 INTAKE Channels	02 CLASSIFICATION Type, Size, Urgency	03 PRIORITIZATION Scoring & Criteria	04 PORTFOLIO Governance	05 DELIVERY Execution
IT BUSINESS APPLICATIONS							
GIS	Electric & Gas Field Operations · OSG	Break/fix · Small · Large	No SLA, no volume tracking	No classification rule below PDD threshold	Heuristic-based; no scoring model	Informal portfolio management	Ad-hoc delivery; no release KPIs
Corporate	Finance · HR · Procurement · Legal · Regulatory	Regulatory · Small/Medium	Requirements in docs; digital trail breaks	No model for small/medium demand	Regulatory is the default priority; no scoring	Governed portfolio with formal approvals	One-year plan; no release KPIs
G&E	P&S · Gas & Electric Ops · Inspections · Outage · Planning	Small · Medium · Large · Quarterly BRP cycles	Quarterly BRP — structured demand intake	PBB Canvas + Backlog Model	Portfolio Estimation Logic (formula-based)	P&T Programs Priorities Overview — single view	BRP-coordinated squads · roles formally aligned
Global SAP (Iberdrola)	Iberdrola Finance · Controlling · Procurement · Vendor	Incidents · Small · Minor · Large	Structured channel taxonomy in place but informal	No model for small/medium demand	Incidents first → strategic starved	Cadenced review; partial governance	KT loss on vendor turnover; 1-yr hiring lag
CUSTOMER SERVICES APPLICATIONS							
Smart Metering (Device & Metering)	Customer Ops · Field Services · Billing · BRS · Vendors	Incidents · Large · Small	Informal intake process	Relies on tool template	'Intrinsic common sense'; not scored	Partial governance	Execution knowledge not owned
Customer Services (4 teams TBC)	7 OPCOs via BRS · PMO · OT · Digital CoE · Infrastructure · Data & Analytics · Regulatory · OT	Regulatory · Large · Small/Medium	No shared channel	No model defined for classification	Done by Director or managers locally	Priority competition between OpCos	Ad-hoc delivery governance

MATURITY: CRITICAL · GAP · PARTIAL · SCALABLE

The operating-model playbook exists internally — the gap is scaling it across Digital Products

EXECUTIVE SUMMARY

VALUE STREAM MAPPING - DEMAND FLOW

The end-to-end AS-IS demand pipeline on one page — eleven source areas funnel into fragmented channels, split by demand type, and land on one of two delivery branches

01 · SOURCES

Who sends the demand

- BRS
- CX & Digital CoE
- Data & Analytics
- Infrastructure
- IA
- OT
- Procurement
- Regulatory
- Corporate Areas
- P&T (GIS)
- P&T (Global SAP)
- Gas & Electric Operations

02 RECIPIENT

Who resolves it

CUSTOMER SERVICES APPS

- FICA / Collection
- Billing, Device & Retail
- SAP Basis
- CRM & Contact Center

IT BUSINESS APPLICATIONS

- Corporate
- GIS
- Global SAP
- G&E

02 · CHANNELS

How the demand arrives — color by type

Jira	BSS Log	MS Office	IT Now	PDD
Jira	Digital PMs	MS Office	PDD	
SharePoint	PDD			
Ms Office	PDD			
SharePoint	PDD			
Jira	PDD			
MS Office	PDD			
Jira	PDD			
Jira	Confluence	MS Office	PDD	
Jira	MS Office	IT Now	PDD	
Jira	PDD			
Jira	MS Office	PDD		

03 · CLASSIFICATION

What kind of demand

A multi classification level that depends both on the nature or particularity of the demand, but also on the level of effort (economics, time, and resources) required

PRODUCTION SUPPORT

Operational activities required to maintain system stability, resolve incidents, and ensure continuous service availability.

REGULATORY

Mandatory initiatives driven by external regulations with fixed deadlines and non-negotiable scope.

NON-REGULATORY

Business-driven initiatives aimed at enhancing capabilities, improving performance, or delivering incremental business value

LARGE · MEDIUM · SMALL

Note: while this model is not currently standardized in the As-Is process, both classifications are partially adopted across all teams

© 2026 NTT DATA, Inc.

COLOR CODING: SMALL < $10k, 1-3 month, < 5 resource · MEDIUM $500k, 3-6 month, <= 10 resource · LARGE Projects that exceed previous limits

EXECUTIVE SUMMARY
CONCLUSIONS

Our assessment highlights opportunities to strengthen alignment, governance, and prioritization to enable a more scalable and sustainable TO□BE operating model.

OPERATING CONSTRAINTS

These are the structural and operational limitations currently constraining the model's ability to scale and deliver value consistently.

This section outlines the key factors:

- People: Capacity & accountability are structurally constrained
- Process: Lack of standardization drives inconsistency
- Tools: Fragmented ecosystem limits visibility and control
- Governance: Decision-making is fragmented

DELIVERY EXPERIENCE AND PAIN POINTS

These are the friction points impacting execution and the business or user experience.

This section describes the main issues identified related to:

- Fragmented demand and intake drive reactive, non-strategic delivery
- Lack of clear product ownership weakens accountability and decision-making
- Limited portfolio visibility constrains end-to-end planning and prioritization
- Uncoordinated capacity and overlapping initiatives reduce efficiency and impact

STRUCTURAL MISALIGNMENT

This refers to the misalignment between the organizational structure, governance model, and the way products are managed and delivered.

This section highlights the structural gaps:

- No Product Entry Point
- No Value-Based Decision-Making
- No End-to-End Product View
- No Ownership of Outcomes
- No Product-Level Steering
- No Common Language of Value
- No Product Ownership Model

FUTURE STATE GUIDING PRINCIPLES

They will serve as a decision-making framework for designing processes, roles, and governance aligned with a more scalable, transparent, and product-oriented model.

- **Demand Intake & Structuring**
- **Value-Based Prioritization**
- **Product Portfolio Management & Planning**
- **Product Governance & Ownership**

© 2026 NTT DATA, Inc.

EXECUTIVE SUMMARY

CURRENT OPERATING CONSTRAINTS

The current operating model is constrained by fragmented ownership, inconsistent processes, and limited visibility across demand, delivery, and outcomes. These structural gaps prevent scalable execution and hinder the shift toward a value-driven, product-centric model.

PEOPLE — Capacity & accountability are structurally constrained

Limited and slow-to-scale capacity (e.g., ~1 year hiring cycle, open leadership roles) reduces responsiveness to growing demand

Unclear ownership and overlapping responsibilities create execution risk and inefficiencies

High vendor dependency limits control over delivery and increases coordination overhead

⚠ Digital Products cannot reliably scale delivery or ensure accountability, impacting timelines and quality.

PROCESS — Lack of standardization drives inconsistency and inefficiency

Fragmented intake and ad-hoc prioritization lead to misaligned decisions and unmanaged demand

Formal processes applied only to large initiatives leave most work without structure or governance

Inconsistent ways of working across teams (PMs, Leads, vendors) increase delivery variability

⚠ Demand is neither consistently evaluated nor executed, reducing predictability and value delivery.

TOOLS — Fragmented ecosystem limits visibility and control

Multiple disconnected intake and tracking tools prevent end-to-end visibility

Lack of portfolio management capabilities across most units limits strategic oversight

Inconsistent and informal tool usage (e.g., spreadsheets, local tools) fragments information

⚠ Leadership lacks real-time transparency to manage demand, capacity, and performance effectively.

GOVERNANCE — Decision-making is fragmented and not value-driven

Multiple forums without portfolio-level ownership dilute accountability and slow decisions

No standardized prioritization criteria leads to inconsistent and non-value-based trade-offs, and always accepting all incoming demand

Limited cross-team alignment mechanisms (e.g., SAP footprints, Business vs IT) create silos

⚠ Decisions are reactive and uncoordinated, limiting alignment with strategic priorities.

© 2026 NTT DATA, Inc.

EXECUTIVE SUMMARY
STRUCTURAL MISALIGNMENT

Seven structural issues surface — no single-area fix resolves them; the TOM must standardize end-to-end

01 — No Product Entry Point

Demand enters through multiple disconnected channels, with no single front door aligned to products or value streams.

(6+ disconnected channels (Jira, IT Now, RITM, SharePoint, Email, Word). No single front door.)

Product model requires a **unified intake layer structured around products**, not tools or channels.

02 — No Value-Based Decisioning

Prioritization is inconsistent and driven by local criteria, with no common definition of value across initiatives.

(Each area uses different criteria — PDD, impact ×users, criticality, operational urgency, common sense.)

Product model requires a **standardized, value-based prioritization framework** tied to **business outcomes**.

03 — No End-to-End Product View

Portfolio management capabilities are fragmented, limiting visibility across demand, capacity, and delivery.

No consistent and standardized use of portfolio tool. Only Smart Metering uses PPM Now.

Product model requires **integrated portfolio tooling to manage products holistically** across their lifecycle.

04 — No Ownership of Outcomes

No standard process to manage delivery. Ownership is unclear across the lifecycle, with teams and vendors defining timelines and follow-up independently

(No standard process to manage delivery. Each team estimates, sets timelines, and follows up on delivery)

Product model requires **clear ownership, performance management, and outcome-based** governance.

05 — No Product-Level Steering

Existing forums are not structured to drive portfolio-level or product-based decisions.

(Different recurring forums exist — but Manager Check-in participants are still TBC; no forum covers portfolio-level decisions.)

Product model requires **governance aligned to product portfolios, with clear accountability** and decision rights.

06 — No Common Language of Value

Lack of standardized definitions of impact (client, business value) prevents consistent evaluation and comparison of work.

Each demand request is worked depending on perception of value and Demand size

Product model requires **a shared taxonomy and classification model** as a foundation for prioritization and planning.

07 — No Product Ownership Model

Work is organized around projects and applications, with limited alignment to value streams or business outcomes.

(Demand is organized by application silo, not by Value Stream. IT requests don't trace to business OKRs)

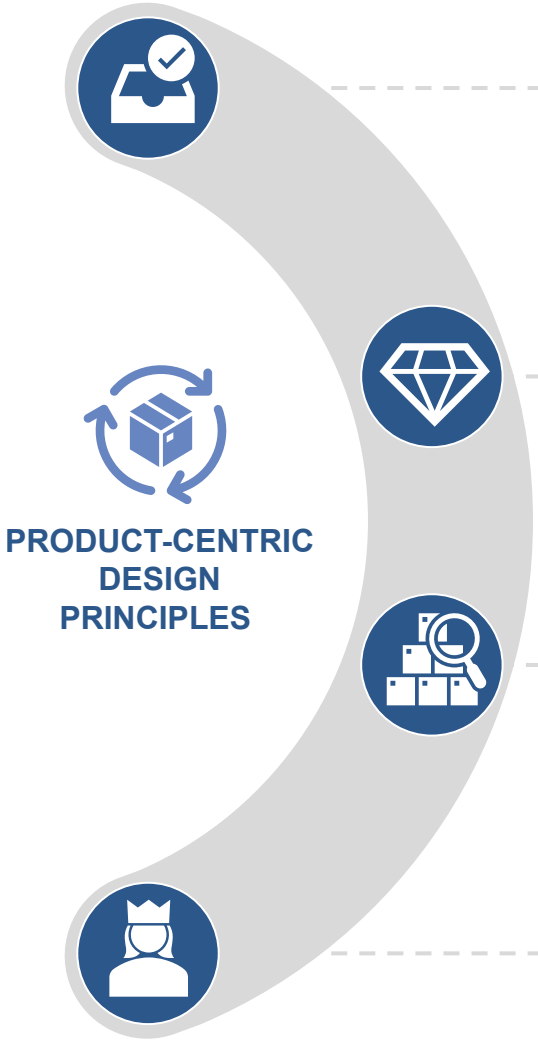

Product model requires **organizing around products, with clear ownership and alignment** to business OKRs.

© 2026 NTT DATA, Inc.

EXECUTIVE SUMMARY

TO-BE GUIDING PRINCIPLES

Four principles guide the Target Operating Model — each answers one of the 7 structural issues and is grounded in prior NTT work with Avangrid

DEMAND INTAKE & STRUCTURING

All demand must be captured through a **unified intake layer aligned to products or value streams**, ensuring **full visibility and traceability**.

- **Single entry point** per product/value stream
- **Standard intake criteria and** mandatory fields
- **Consistent demand categorization** across teams (type, size, complexity, value driver)
- **Clear ownership** for triage and backlog assignment

VALUE-BASED PRIORITIZATION

Demand is consistently **evaluated and prioritized using a standardized framework** tied to **business outcomes**.

- **Common scoring model** (value, urgency, risk, effort)
- **Transparent prioritization** across competing demands
- **Product-level backlog** ownership
- **Trade-offs made at portfolio/product** governance level

PRODUCT PORTFOLIO MANAGEMENT & PLANNING

End-to-end visibility enables coordinated planning across demand, capacity, and delivery.

- **Integrated portfolio view** across all products
- **Capacity planning aligned to product priorities**
- **Roadmaps managed at product level** (not project level)
- **Continuous tracking of delivery and outcomes**

PRODUCT GOVERNANCE & OWNERSHIP

Clear **accountability and governance** ensure decisions are aligned to product outcomes.

- **Defined roles** (Product Owner / Product Manager / Tech Lead)
- **Product-based governance forums** with decision rights
- **Vendor management aligned to product** performance
- **KPIs tied to product outcomes and business value**

01 Context
Document summary

02 Executive Summary
Why we are here. Executive findings & implications. Methodology (Wave 1 Step 1 sources).

03 Methodology
A structured approach that defines the phases, activities, and deliverables required to consistently and efficiently achieve project objectives

04 Current State Analysis
Includes explanations for Roles and Responsibilities, Value stream Mapping, tools and Governance Mapping

05 Project Portfolio Landscape
An overview of the Digital Products' current demand and tool portfolio

06 Insights & Key Definitions for To-Be Model
A synthesis of key insights and foundational definitions shaping the design of the target operating model

METHODOLOGY

This project follows a structured, end-to-end approach to assess the current state, design the future operating model, enable it through tools, validate it in a live pilot, and refine it for scaling. Each step builds progressively to ensure measurable impact and readiness for broader adoption.

Step 1 Enablement

Where are we starting from?

Prior materials review
Stakeholder interviews
Portfolio Assessment

To establish a fact-based understanding of the current state and identify the key gaps that must be addressed in the new model.

Baseline Report

- Baseline Report
- Demand Map
- Project Portfolio Landscape (SAP)

Step 2 Define Lifecycle

How should we work?

End-to-End Process Map
Value Framework V1.0
Roles & RACI Matrix

To create a clear, standardized way of working that aligns roles, decisions, and value-based prioritization end-to-end.

- Lifecycle Map v1.0
- Demand Typology
- Prioritization Framework
- Roles & RACI Matrix

Step 3 Design Tool Ecosystem

What supports the process?

Jira Configuration V1.0
Intake Form Design
PPM Now Integration Concept

To ensure the right tools and configurations support the new lifecycle and enable integration, visibility, and scalability.

Tool Design

- Tool Ecosystem Design
- Jira Configuration v1.0
- Portfolio Concept Blueprint

Step 4 Pilot Execution (BRS)

Does it work in reality?

Execute 1 BRS Project
End-to-End Run (Intake → Report)
Real-time Feedback Log
Pilot team training

To validate the new operating model in a real project and test whether it works effectively in practice.

- Pilot Execution Report
- First Reporting Output
- Structured Feedback Log

Step 5 Learn & Adjust

What needs refinement?

Analyze Pilot Data
Refine Jira Config (V2.0)
Adjust Value Scoring
Playbook

To refine the model based on real feedback and prepare a stronger, scalable version for broader adoption.

Config v2.0

- Lifecycle Map v2.0
- Jira Config v2.0
- Value Criteria Framework v2.0

© 2026 NTT DATA, Inc.

METHODOLOGY

This phase focused on executing a set of targeted activities to establish the baseline, including stakeholder interviews, demand and portfolio mapping, and capacity & reporting analysis.

Step 1	Step 2	Step 3	Step 4	Step 5
Enablement	**Define Lifecycle**	**Design Tool Ecosystem**	**Pilot Execution (BRS)**	**Learn & Adjust**
Where are we starting from?	*How should we work?*	*What supports the process?*	*Does it work in reality?*	*What needs refinement?*

05 Project Portfolio Landscape
An overview of the Digital Products' current demand and tool portfolio

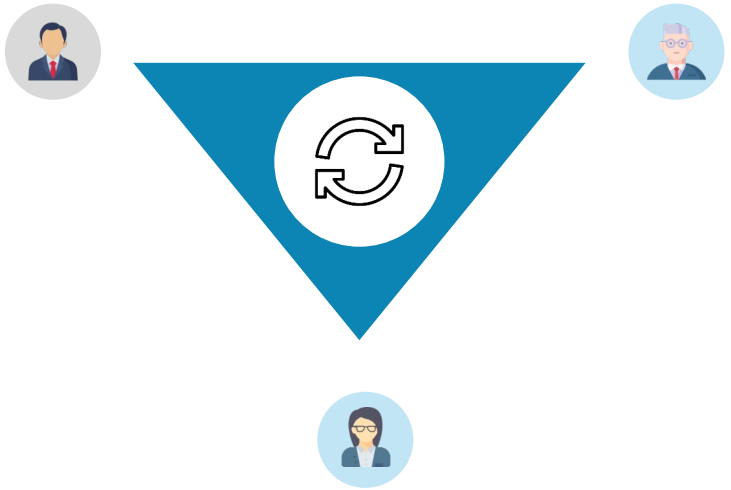

06 Insights & Key Definitions for To-Be Model
A synthesis of key insights and foundational definitions shaping the design of the target operating model

CURRENT STATE ANALYSIS

Digital Products is currently structured around three core teams, following the recent establishment of the Product Management function, IT Business Applications and Customer Service Applications.

IT BUSINESS APPLICATIONS

The IT Business Applications team is responsible for designing, building, testing, and supporting technology solutions by delivering scalable, secure, and reliable systems that **enable both field operations and back-office processes.**

CUSTOMER SERVICES APPLICATIONS

The Customer Services team is responsible for designing, building, testing, and supporting technology solutions in close collaboration with Product Management by delivering scalable, secure, and reliable systems that **enable Customer Services processes.**

PRODUCT MANAGEMENT

This team align priorities, ensure business technological enablement and coordinate execution with business and IT to realize business value and set a delivery roadmap

IT Business Applications and Customer Services Applications areas are responsible for translating business requirements into actionable specifications across back-, middle-, and front-office domains, ensuring effective solution design and development. Complementing this, the Product Management team plays a central role in aligning priorities, coordinating execution between Business and IT, and driving the product roadmap to ensure consistent value delivery.

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

Digital Products spans two director branches (~50 FTE) across nine sub-teams and a new team of Product Management and IT Program Delivery

Vitor Cruz
VP — IT Business Solutions Delivery

Carlos Garbin — Director IT Business Applications (~26 FTE)

Bruno Moreto
Electric & Gas Ops
7 FTE
G&E Champion: ***Andrew McGibbon***

George Porto
GIS & OSG
6 FTE
GIS Champion: ***George Porto***

Sarath Garikapati
Corporate Applications
8 FTE
Corporate Champion: ***Amit Patel***

Vanessa Colombo
Global SAP — Iberdrola FI, PO, Budget (Spain)
5 FTE
Global SAP Champion: ***Michael Dubois***

Area champion identified (6)

Kumar Jaladanki — Director Customer Services Apps (~24 FTE)

Ivelisse Velazquez
FICA, Billing & Collection
8 FTE
SAP Champion: ***Stephanie***

TBD (vacant)
CRM & Contact Center Ops
4 FTE

2 FTE

Heather Lajoie, - Director of Product Management (2 FTEs)

Vacant
Product Management
2 FTE

This team **acts as the strategic coordination layer** across delivery and execution teams, ensuring alignment between business priorities and technical implementation.

It is responsible for shaping and supporting the prioritization of work, providing direction and guidance to both teams throughout execution and development activities. In this role, the **team enables consistent focus on value creation**, ensuring that efforts are aligned with business outcomes and delivered efficiently through the effective orchestration of dependent teams.

IT Program Delivery (Vacant)

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

IT Business Apps | Customer Services Apps | Product Management

NTT DATA

IT Business Applications runs Avangrid's non-SAP operational backbone — four teams supporting Electric & Gas, GIS, Corporate and Iberdrola Global SAP.

NATURE OF WORK

Operational continuity + regulated change

- Keep the lights on — break/fix is the dominant pattern (GIS, G&E, Corporate).
- Large demand planned yearly via PDD; small/medium demand handled ad-hoc.
- Regulatory and employee-facing systems (Corporate) run under continuous compliance pressure.
- Version upgrades (Projectwise, Microstation) gate-kept by Third-Party Risk assessment.

APPLICATIONS IN SCOPE

Four technology domains under Carlos

- GIS & OSG — SAP HANA, ARCFM, GIS web apps, data replication, SWF platform (George Porto, ~6 FTE).
- Electric & Gas Ops — 70–90 apps, android/tablets, doc viewer (Bruno Moreto + Andrew McGibbon, ~7 FTE).
- Corporate Applications — 5-6 PMs, 2 tech leads, corporate + network apps, SWF tooling (Sarath + Amit, ~8 FTE).
- Global SAP (Iberdrola) — FI, PO, Budget — Spain-side SAP module support (Vanessa + Michael, ~5 FTE).

WAY OF WORKING & INTERACTIONS

Inside-IT + vendor + business triangulation

- Inside Applications: GIS ↔ G&E (shared SAP/GIS data); Corporate ↔ all teams (shared PMs).
- With SAP branch: Global SAP ↔ Kumar's SAP (Billing, FICA); P&T is the intermediary with Business.
- With vendors: Accenture (Global SAP + Corporate), SWF / Software Factory (all teams), business vendors (G&E).
- Tools mix: Jira (misc), IT Now (incidents), PDD (large), SharePoint + Teams + OneNote + Email (PM).
- Project managers identified as part of the team, but opportunity to include more product-oriented roles focused on lifecycle management and business alignment

PRIORITIES TODAY

Break/fix first, regulatory second, strategic last

- GIS: keep the lights on; team & SWF resource management; future technology roadmap.
- Corporate: regulatory and employee-facing systems — always priority; continuous new requirements.
- G&E: ProjectWise + Microstation upgrades; third-party risk interface; business case approvals (slow).
- Global SAP: incident volume dominates — strategic projects slip; 1-year hiring lag amplifies load.

TEAMS UNDER CARLOS

75% are Sr Manager

- Bruno Moreto – Sr, Manager Electric &Gas Operations Products
- George Porto — Sr Manager GIS & OSG
- Sarath Garikapati — Sr. Manager Corporate Applications
- Vanessa Colombo — Manager IT Apps Global SAP

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

Customer Services Apps owns the Meter-to-Cash (M2C) value chain for the OPCOs — from meter reading through invoicing, customer interaction and cash collection — anchored on SAP (Billing · FICA · CRM · Metering)

NATURE OF WORK

Customer-facing SAP + metering + contact center

- Meter-to-Cash backbone for end-customers across 7 OPCOs — every kWh consumed is metered, billed and collected through these systems
- SAP (Avangrid US) — Billing, FICA, CRM, Metering modules; distinct stack from Global SAP (Iberdrola Spain)
- Regulated environment — each state PUC (CT, ME, NY) imposes its own rate cases, billing rules and reporting cycles
- Demand sourced: BRS (OPCO business demand) · PMO (capex projects) · Business Areas
- Software Factory (SWF) executes; Accenture supports incidents and large projects

WAY OF WORKING & INTERACTIONS

- Small/medium business demand (price changes, new tariff types, dunning rules) → BRS → Jira
- Large capex projects (S/4 Hana, smart-meter rollout, CRM upgrades) → PMO → PPM Now → SharePoint + Teams
- Incidents (billing run failures, payment processing errors, meter data gaps) → IT Now (template)
- Cross-team interactions: Kumar (PMO + IT) ↔ BRS leads (business demand) ↔ Vanessa Colombo (Global SAP integration points)
- Vendor concentration: Smart Metering = 100% vendor-delivered (requirements + code); other teams rely on Accenture + SWF muscle

TEAMS UNDER KUMAR -

5 sub-teams, heterogeneous maturity

- Ivelisse Velazquez — FICA, Billing & Collection — The "Cash" of M2C — invoicing, payment processing, collections, dunning across 7 OPCOs
- Vincent Lam — Device & Metering (Iram Chowdhury / Smart Metering sits here) — The "Meter" of M2C — meter data acquisition, regulatory smart-meter rollout
- Nagi Reddy — SAP Basi — Platform foundation — landscape, transports, security, performance — Billing/CRM/Metering can't run a single bill without it
- TBD (vacant) — Sr. Manager CRM & Contact Center Ops — Customer interaction — every call, service request, complaint and account-management touchpoint with the customer
- Open (vacant) — Sr. Manager SAP & CS Architecture (~2 FTE) — Multi-OPCO architectural coherence — without it, every cross-OPCO design decision becomes tribal and inconsistent

APPLICATIONS IN SCOPE

- **Meter** *(devices · data acquisition)*
  - Group 8760 (EDI) · SAP CRM (Front-office device events)
- **Bill** *(invoice generation · pricing)*
  - SAP ECC · StreamServe (invoice formatting)
- **Collect** *(payments · dunning · tax)*
  - SOVOS Taxware (tax/compliance) · Precisely (Pitney Bowes — address validation · mailing)
- **Customer Interaction** *(CX layer)*
  - HCL-Nuance (customer-service IVR) · Medallia VHT (customer feedback) · Infosys (managed services)
- **Platform & Operations**
  - Gold Client (data management) · SAP WPB Enable Now (training · adoption) · Blue Prism (RPA · process automation) · SAP Tricentis TOSCA (test automation)

PRIORITIES TODAY

- S/4 Hana Migration — multi-year program touching all 7 OPCOs simultaneously (largest single initiative)
- M2C reliability — every billing day is a hard deadline; incident impact = customer + revenue + regulatory triple hit
- OPCO-specific demand — each of the OPCOs brings its own backlog through BRS; multi-OPCO contention is daily

CURRENT STATE ANALYSIS

IT Business Apps | Customer Services Apps | **Product Management**

NTT DATA

Product Management acts as the intended integrator between Business and IT — but lacks formal ownership of prioritization, intake, and portfolio decisions

ROLE & INTENDED MANDATE

- Acts as the bridge between Business (BRS), IT, and delivery teams
- Supports demand planning and BRD definition, ensuring value is captured
- Provides input into prioritization and portfolio discussions
- Participates in planning cadences (Big Room, backlog, dailies)Expected to align demand with business outcomes and capacity

PRIORITIZATION & DEMAND MANAGEMENT TODAY

- Prioritization varies by OpCo, with no common framework
- Regulatory and incidents take precedence over strategic initiatives
- No standardized scoring model or trade-off mechanism
- Demand enters through multiple channels (PDD, JIRA, email, business requests)
- Backlog is not actively managed (items remain without rejection/closure)

KEY LIMITATIONS

- No formal ownership of intake, backlog, or prioritization decisions
- Limited influence on large initiatives (PDD / budget-driven projects)
- Lack of standard processes and governance across OpCos
- Communication gaps on what is prioritized and why
- Weak alignment between work delivered and business value

WAY OF WORKING & INTERACTIONS

- Strong interaction with BRS through BSS log with two standardized OpCos and a third non-standard Process for the third OpCo
- Strong interaction with SAP Customer Services for demand shaping and value definition
- Engagement across different teams, including backlog and delivery discussions
- Participation in Big Room Planning (quarterly) and daily team syncs
- Interfaces with:
  - Business (requirements, value)
  - IT (delivery, feasibility)
  - PMO / leadership (large initiatives)
  - Tools & channels fragmented: JIRA, PDD, email, meetings.

PORTFOLIO & ROADMAP VISIBILITY

- No consolidated portfolio view across products or demand types
- Limited tracking of demand volume, capacity, and delivery progress
- Roadmaps are short-term (~1 year) and lack defined initiatives
- No clear linkage between:
  - Demand
  - Prioritization
  - Execution
  - value delivered

Product Management is a newly established function that is still in the process of being structured, with roles, processes, and governance not yet fully defined or embedded. This creates a critical opportunity to formalize ownership, standardize ways of working, and position the function as the true integrator of demand, prioritization, and value delivery across Business and IT.

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - METHODOLOGY

Five sequential stages and four maturity levels — the same analytical grid applied to every team, so fragmentation can be measured, not just described.

STANDARD LIFECYLE MAP

01 INTAKE

Channels · Sources

How work arrives today: Jira, IT Now, Email, SharePoint, Word. Who submits, how often, what type.

02 CLASSIFICATION

Type · Size · Urgency

How requests are categorized: small vs. large, regulatory flags, acceptance criteria.

03 PRIORITIZATION

Scoring · Criteria

How work is ranked: who decides, which criteria apply, how conflicts are resolved.

04 PORTFOLIO

Governance · Decision

Where initiatives live: PDD approval, portfolio tool, funding model, steering forums.

05 DELIVERY

Execution · Flow

How work gets done: internal / SWF / Vendor mix, progress tracking, release cadence.

MATURITY ASSESSMENT

MATURITY SCALE

Applied to every cell of the AS-IS matrix

- **CRITICAL** — *Missing or broken — requires immediate redesign*
- **GAP** — *Exists but inadequate — insufficient*
- **PARTIAL** — *Functional but inconsistent across teams*
- **SCALABLE** — *Mature and scalable — import to Target Operating Model*

THE FRAMEWORK

Value-Stream Mapping of the end-to-end demand lifecycle — 5 sequential stages that every demand must pass through, from the moment it arrives to the moment it is delivered.

WHY WE USE IT

Provides a standardized lens to compare heterogeneous teams (6 intake channels, 6 prioritization logics) apples-to-apples — without this, every area's working answer looks locally valid but none scales.

WHAT IT REVEALS

Per-stage maturity gaps per team, cross-branch fragmentation, and the specific bottlenecks the TOM must resolve — converting anecdote into structured evidence for the Baseline Report.

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

NTT DATA

Across both IT Business Applications and Customer Service Applications, only 1 area already operate at scale — G&E , the rest still run 6+ disconnected channels

	SOURCE Who sends the demand	TYPES What kind of demand	01 INTAKE Channels	02 CLASSIFICATION Type, Size, Urgency	03 PRIORITIZATION Scoring & Criteria	04 PORTFOLIO Governance	05 DELIVERY Execution
IT BUSINESS APPLICATIONS							
GIS	Electric & Gas Field Operations · OSG	Break/fix · Small · Large	No SLA, no volume tracking	No classification rule below PDD threshold	Heuristic-based; no scoring model	Informal portfolio management	Ad-hoc delivery; no release KPIs
Corporate	Finance · HR · Procurement · Legal · Regulatory	Regulatory · Small/Medium	Requirements in docs; digital trail breaks	No model for small/medium demand	Regulatory is the default priority; no scoring	Governed portfolio with formal approvals	One-year plan; no release KPIs
G&E	P&S · Gas & Electric Ops · Inspections · Outage · Planning	Small · Medium · Large · Quarterly BRP cycles	Quarterly BRP — structured demand intake	PBB Canvas + Backlog Model	Portfolio Estimation Logic (formula-based)	P&T Programs Priorities Overview — single view	BRP-coordinated squads · roles formally aligned
Global SAP (Iberdrola)	Iberdrola Finance · Controlling · Procurement · Vendor	Incidents · Small · Minor · Large	Structured channel taxonomy in place but informal	No model for small/medium demand	Incidents first → strategic starved	Cadenced review; partial governance	KT loss on vendor turnover; 1-yr hiring lag
CUSTOMER SERVICES APPLICATIONS							
Smart Metering (Device & Metering)	Customer Ops · Field Services · Billing · BRS · Vendors	Incidents · Large · Small	Informal intake process	Relies on tool template	'Intrinsic common sense'; not scored	Partial governance	Execution knowledge not owned
Customer Services (4 teams TBC)	7 OPCOs via BRS · PMO · OT · Digital CoE · Infrastructure · Data & Analytics · Regulatory · OT	Regulatory · Large · Small/Medium	No shared channel	No model defined for classification	Done by Director or managers locally	Priority competition between OpCos	Ad-hoc delivery governance

MATURITY: CRITICAL · GAP · PARTIAL · SCALABLE

The operating-model playbook exists internally — the gap is scaling it across Digital Products

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

GIS balances break/fix urgency against yearly PDD planning — with no formal channel for small demand

BUSINESS REQUESTERS | Electric & Gas Field Operations · OSG (Operational Support Group)

	01 INTAKE	02 CLASSIFICATION	03 PRIORITIZATION	04 PORTFOLIO	05 DELIVERY
	PARTIAL	PARTIAL	PARTIAL	PARTIAL	PARTIAL
CHANNELS · HOW IT ARRIVES	Jira (misc. work) + Email / Meetings + IT-Now (daily break/fix)	Small: email, Jira ; Incidents: IT Now ; Large: yearly PDD process with no formal classification	Business drives prioritization; P&T is the face for small demand	PDD-approved portfolio; no dedicated portfolio tool	Internal team for break/fix; SWF brought in for resource impact
ROLES	Business users open tickets; GIS Sr Manager team receives	GIS Senior Manager + team classify; PDD committee for large demand	"Impact to most users" rule (GIS Champion); PDD approvers for large	Informal Portfolio Management — GIS Senior Manager manages via OneNote / Teams / spreadsheets	GIS team + Software Factory (shared server infra: SAP HANA, ARCFM)
TOOLS	Jira + Email + Meetings + IT-Now (RITM)	No single tool — Jira tags + PDD workbook	Spreadsheet-based; no scoring tool	OneNote + Teams + Spreadsheets (informal) + PDD (large)	Jira (internal) + SWF process (vendor capacity)
GOVERNANCE & METRICS	No SLA on small demand; no volume tracking. No DoR / triage rule	No classification rule below PDD threshold	"Highest impact / most users" — heuristic, not scored	PDD governance works for large; no below-threshold governance	SWF engagement tracked ad-hoc; no KPIs per release

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- GIS treats "small demand" and "break/fix" as interchangeable — volume grows, prioritization logic doesn't scale
- PDD works for large projects but leaves 60-70% of actual work (break/fix + small) ungoverned
- SWF is the elasticity valve — predictable capacity relief, but vendor-dependent and untracked

SUPPORTING QUOTE

"I prioritize things that have the highest impact to the most users. In most cases these are break/fix requests" — GIS Sr. Manager / Champion

GIS has a working large-project process (PDD) but relies on email + meetings for small demand — capacity risk as volume grows

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

Corporate runs demand through Jira, Confluence and Word — standardization gap despite the highest regulatory pressure

BUSINESS REQUESTERS | Electric & Gas Field Operations · OSG (Operational Support Group)

	01 INTAKE	02 CLASSIFICATION	03 PRIORITIZATION	04 PORTFOLIO	05 DELIVERY
	PARTIAL	PARTIAL	PARTIAL	PARTIAL	PARTIAL
CHANNELS · HOW IT ARRIVES	PM via Jira + Confluence; Word docs for business requirements	Small and Medium: PDD	PDD is the driver; regulatory is treated as standing priority	PDD-approved portfolio;	Internal + Vendor split; regulatory-driven release cadence
ROLES	Business analysts send requirements; PMs own Jira intake	5-6 PMs + 2 Tech Leads classify (central PM pool sits here)	PMs + business leadership — regulatory always lifted	PMs track Jira; overlap visible but not resolved upstream	Internal team + SWF + vendors for specific modules
TOOLS	Jira · Confluence · Word docs · PPM Now	Jira labels + PDD workbook	No scoring tool — regulatory = priority	Confluence + PPM Now	Jira + Confluence; SWF for vendor capacity
GOVERNANCE & METRICS	No consolidated intake funnel; Word breaks digital trail	No deduplication between overlapping PDDs	Regulatory urgency is exception-driven, not scored	PDD approvals govern; below-threshold demand untracked	One-year plan + recurring training; no release KPIs

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- Word-document requirements betray a pre-agile posture — downstream Jira adoption is superficial, not structural
- "Overlapping projects" signals classification breakdown: multiple PDDs chase similar outcomes because intake doesn't deduplicate
- Regulatory pressure masks the lack of formal scoring — everything becomes urgent by exception

SUPPORTING QUOTE

"No prioritization variables defined but forums to prioritize. Currently in the forums: if it's strategic, operational urgency, regulatory (most important doesn't matter the size)" — Amitkumar Patel

Corporate absorbs regulatory volatility through PDD — but Word-doc intake and overlap between projects create duplication and rework

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

G&E inherits Avangrid's most mature operating model with quarterly BRP, structured backlog and portfolio estimation already in place

BUSINESS REQUESTERS — P&S · Electric & Gas Operations · Field Services · Outage Management · Regulatory

	01 INTAKE	02 CLASSIFICATION	03 PRIORITIZATION	04 PORTFOLIO	05 DELIVERY
	SCALABLE	SCALABLE	SCALABLE	SCALABLE	SCALABLE
CHANNELS · HOW IT ARRIVES	Quarterly BRP cycle. Structured demand intake from P&S	PBB Canvas + Backlog Model applied at intake	Portfolio Estimation Logic — formula-based scoring	Single portfolio view across P&T programs	Squad-based execution coordinated at BRP
ROLES	P&S business owners (Process Improvement managers) submit through BRP	Program Manager and Product Owners	Portfolio Manager (PFM) leads scoring with business sponsors	PFM owns portfolio governance end-to-end	Roles & Responsibilities formally aligned per BRP framework
TOOLS	PBB Canvas · Backlog Model	Standard taxonomy applied	Portfolio Estimation Formula (higher-value prioritization)	P&T Programs Priorities Overview (running document)	BRP execution model with squads
GOVERNANCE & METRICS	Quarterly cadence enforced;	Standard taxonomy enforced enterprise-wide	Reviewed at every BRP — not exception-driven	Portfolio reviewed at cadence	KPIs tracked per program; vendor scope governed within portfolio

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- P&S / P&T have already implemented Avangrid's most mature operating model — quarterly BRP, structured backlog, portfolio estimation logic — proving the TO-BE concept exists internally
- G&E inherits this maturity by sitting within P&T's portfolio — not a fragmentation case, but an example of what the rest of Digital Products should adopt

SUPPORTING QUOTE

"By 2029, P&S and IT Networks aim to establish themselves as one unified collaborative team alongside business units — recognized as drivers of meaningful organizational change across Avangrid through simpler, smarter and more efficient processes." — P&S / IT Networks Vision 2029

G&E is not the canary — it is the proof point. Avangrid already runs a mature operating model due to P&T involvement; the TO-BE for Digital Products is to scale this playbook across IT Business Apps and Customer Services Apps.

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS
VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

Global SAP — Iberdrola has the most mature channel taxonomy — but is trapped by incident overload

BUSINESS REQUESTERS — Iberdrola Finance · Controlling · Procurement · Vendor

	01 INTAKE	02 CLASSIFICATION	03 PRIORITIZATION	04 PORTFOLIO	05 DELIVERY
	PARTIAL	PARTIAL	CRITICAL	PARTIAL	PARTIAL
CHANNELS · HOW IT ARRIVES	IT Now (Incidents) · RITM (Minor) · Jira (Small Demands) · SharePoint + Teams (Projects)	Small: JIRA · Minor: RITM · Major: SharePoint	#1 Incidents always first; #2 Small + Major; P&T prioritizes projects	PDD for major projects; SharePoint is project home	
ROLES	Business users open tickets; Global SAP team receives	Classification is tool-driven — channel = classification	Leader prioritizes + leadership call incidents first; P&T helps with projects	Leader owns weekly incident review (Thursday, with Accenture)	Vendor for incidents; SWF for projects; P&T for intermediary
TOOLS	IT Now · IT Now RITM · Jira · SharePoint · Teams	IT Now + Jira + SharePoint (by channel)	No scoring tool — incidents-first rule	SharePoint (projects) + PDD (approval) + Thursday incident meeting	Vendors delivery stack + SWF pipeline
GOVERNANCE & METRICS	Strongest channel taxonomy in the org — but tuned for incidents	Channel taxonomy = de-facto classification	Incident volume caps strategic capacity ("entire team on incidents")	Weekly Vendor incident review governs incidents; projects via PDD	Knowledge transfer loss at every turnover — 1-year hiring lag

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- Channel taxonomy is the strongest in the organization — but it was designed around incidents, not strategic demand as it has most of the demand
- Incidents-first rule means strategic work enters a de-facto waiting queue — hiring lag (1 year) keeps the queue deep
- Vendor + SWF dependency is the hidden scaling mechanism — cost and knowledge concentrate outside Avangrid

SUPPORTING QUOTE

"Balance all the demands: Incidents, Small Demands, Major projects (PDD). Limited resources — 1 year to hire someone" — Michael Dubois

Global SAP's channel taxonomy - incident flood caps strategic capacity; reducing incident load is the leverage point

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

Smart Metering is the only area fully vendor-delivered with PPM Now + Confluence — but relies on "intrinsic common sense" for prioritization

BUSINESS REQUESTERS — Customer Ops · Field Services · Billing · BRS · Vendors

	01 INTAKE	02 CLASSIFICATION	03 PRIORITIZATION	04 PORTFOLIO	05 DELIVERY
	GAP	PARTIAL	PARTIAL	PARTIAL	CRITICAL
CHANNELS · HOW IT ARRIVES	Small demands via email (IT Now); normal flow — not seasonal	Incidents: IT Now template; requirements usually clear	Criticality + deadline + application priority	PPM Now (large) + Jira + Confluence (PM-to-PM)	100% vendor-delivered portfolio — vendors = consultants + code
ROLES	Business users opens IT Now / email; Smart Metering Champion (PM) receives	Smart Metering PM + team classify by template; vendor tech lead joins	Smart Metering PM prioritizes on deadline + criticality — "intrinsic common sense"	Smart Metering PM + manager (weekly); vendor PMs help PMs prioritize	Vendors do requirements AND code; Avangrid = product owner
TOOLS	Email · IT Now (template) · occasional RITM	IT Now template = primary classification	No scoring tool — judgment + weekly cadence	PPM Now + Confluence + Jira — most mature stack in scope	Vendor stack for build; Confluence for portfolio documentation
GOVERNANCE & METRICS	Channel-based taxonomy formalizes intake— but SLA, aging & volume tracking exist only for IT Now	Template-based → consistent, but no cross-team view	"Intrinsic common sense" = tribal knowledge risk	Weekly meeting governs; PPM Now = only portfolio instance in CS branch	If vendor exits, execution knowledge is lost — 100% dependency

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- 100% vendor delivery (requirements + code) means Avangrid owns no execution knowledge — if the vendor exits, everything stops
- "Intrinsic common sense" for prioritization signals tribal knowledge — works at current scale, fails on leadership transition

SUPPORTING QUOTE

"All portfolio in vendor. Vendors are the consultants for the work — getting requirements on tech side, steps to follow and do the code also — all custom applications" — *Smart Metering Champion (PM)*

Smart Metering is the most tool-mature area — but full vendor dependency and intuitive prioritization create knowledge and governance risk

© 2026 NTT DATA, Inc.

CURRENT STATE ANALYSIS

VALUE STREAM MAPPING - DEMAND FLOW

IT Business Apps | Customer Services Apps

NTT DATA

Customer Services has working sub-teams but no branch-level governance — Prioritization and Portfolio are both GAPs

BUSINESS REQUESTERS	OPCOs via BRS · PMO · Business users				
	01 INTAKE	**02 CLASSIFICATION**	**03 PRIORITIZATION**	**04 PORTFOLIO**	**05 DELIVERY**
	PARTIAL	PARTIAL	GAP	GAP	PARTIAL
CHANNELS · HOW IT ARRIVES	Email + IT Now ; Jira; no shared branch channel	Incidents: IT Now template; Large: PMO; Small/Med→Jira	Criticality ; director-level calls elsewhere	no branch-wide tool	SWF + Accenture + Vendors
ROLES	Business areas / BRS / OPCOs users open varied channels	By sub-team (Metering/FICA/CRM/Basis); PMO for large	CS Director + sub-team managers;	PMO (large) + sub-team managers (small); no portfolio lead	SWF runs projects; PM + SAP Architect roles in place (large)
TOOLS	IT Now + Email + Jira + no cross-channel funnel	IT Now template + Jira labels + PPM (large)	Forum criteria (strategic / ops / regulatory / size) — applied by sub-team	SharePoint · Confluence	SWF delivery pipeline · vendor stacks (per sub-team)
GOVERNANCE & METRICS	No branch-wide governance	Double routing: PMO / BRS	No formal model; regulatory overrides size	7 OPCOs compete for the same IT capacity — multi-OPCO contention	Heavy vendor concentration;

KEY PATTERNS — WHAT THE FINDINGS REVEAL

- Three parallel ownership tracks without a routing rule —PMO for large projects, BRS for business-funded work, Business areas— the same request can land in any of them, blurring accountability and prioritization
- PM + SAP Architect roles are in place for large projects— the gap is not in roles, it's in branch-wide portfolio visibility

SUPPORTING QUOTE

"Who is in charge of what — 3 people can run the payment jobs for example. Resource allocation — multiple OPCOs competing by capacity" — CS Director — Customer Services

All OPCOs compete for the same IT capacity with no branch-wide portfolio view — no capacity allocation in place. Branch-level demand reconciliation is the structural prerequisite for any TO-BE governance.

06 Insights & Key Definitions for To-Be Model
A synthesis of key insights and foundational definitions shaping the design of the target operating model

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

OVERALL CONCLUSIONS

Our assessment highlights opportunities to strengthen alignment, governance, and prioritization to enable a more scalable and sustainable TO□BE operating model.

OPERATING CONSTRAINTS

These are the structural and operational limitations currently constraining the model's ability to scale and deliver value consistently.

This section outlines the key factors:

- People: Capacity & accountability are structurally constrained
- Process: Lack of standardization drives inconsistency
- Tools: Fragmented ecosystem limits visibility and control
- Governance: Decision-making is fragmented

DELIVERY EXPERIENCE AND PAIN POINTS

These are the friction points impacting execution and the business or user experience.

This section describes the main issues identified related to:

- Fragmented demand and intake drive reactive, non-strategic delivery
- Lack of clear product ownership weakens accountability and decision-making
- Limited portfolio visibility constrains end-to-end planning and prioritization
- Uncoordinated capacity and overlapping initiatives reduce efficiency and impact

STRUCTURAL MISALIGNMENT

This refers to the misalignment between the organizational structure, governance model, and the way products are managed and delivered.

This section highlights the structural gaps:

- No Product Entry Point
- No Value-Based Decision-Making
- No End-to-End Product View
- No Ownership of Outcomes
- No Product-Level Steering
- No Common Language of Value
- No Product Ownership Model

FUTURE STATE GUIDING PRINCIPLES

They will serve as a decision-making framework for designing processes, roles, and governance aligned with a more scalable, transparent, and product-oriented model.

- **Demand Intake & Structuring**
- **Value-Based Prioritization**
- **Product Portfolio Management & Planning**
- **Product Governance & Ownership**

© 2026 NTT DATA, Inc.

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

CURRENT OPERATING CONSTRAINTS

The current operating model is constrained by fragmented ownership, inconsistent processes, and limited visibility across demand, delivery, and outcomes. These structural gaps prevent scalable execution and hinder the shift toward a value-driven, product-centric model.

PEOPLE — Capacity & accountability are structurally constrained

Limited and slow-to-scale capacity (e.g., ~1 year hiring cycle, open leadership roles) reduces responsiveness to growing demand

Unclear ownership and overlapping responsibilities create execution risk and inefficiencies

High vendor dependency limits control over delivery and increases coordination overhead

⚠ Digital Products cannot reliably scale delivery or ensure accountability, impacting timelines and quality.

PROCESS — Lack of standardization drives inconsistency and inefficiency

Fragmented intake and ad-hoc prioritization lead to misaligned decisions and unmanaged demand

Formal processes applied only to large initiatives leave most work without structure or governance

Inconsistent ways of working across teams (PMs, Leads, vendors) increase delivery variability

⚠ Demand is neither consistently evaluated nor executed, reducing predictability and value delivery.

TOOLS — Fragmented ecosystem limits visibility and control

Multiple disconnected intake and tracking tools prevent end-to-end visibility

Lack of portfolio management capabilities across most units limits strategic oversight

Inconsistent and informal tool usage (e.g., spreadsheets, local tools) fragments information

⚠ Leadership lacks real-time transparency to manage demand, capacity, and performance effectively.

GOVERNANCE — Decision-making is fragmented and not value-driven

Multiple forums without portfolio-level ownership dilute accountability and slow decisions

No standardized prioritization criteria leads to inconsistent and non-value-based trade-offs, and always accepting all incoming demand

Limited cross-team alignment mechanisms (e.g., SAP footprints, Business vs IT) create silos

⚠ Decisions are reactive and uncoordinated, limiting alignment with strategic priorities.

© 2026 NTT DATA, Inc.

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

DELIVERY & EXPERIENCE PAIN POINTS (1/2)

Four critical bottlenecks are driving demand risk across the end-to-end Business Applications lifecycle (intake to portfolio management)

BUSINESS APPLICATIONS

01

STAGE: Intake - Delivery

App-Owner Mindset, Not Product Mindset

" We need to have standardization — processes, demand intake and report. " — Carlos Garbin

Across both branches, demand is owned at the application level — not by Product Managers/ POs accountable for end-to-end business outcomes. Each team optimizes its own application; no one owns the joint customer journey or value-stream result.

IMPACT

Prevents structured demand management and limits the ability to prioritize and manage work at the product level.

02

STAGE: Prioritization

Global SAP Incident Flood

"Sometimes entire team is focusing on incidents" — Michael Dubois

Incident demand consistently takes precedence over all other work, consuming a significant portion of team capacity and displacing planned initiatives. This creates a reactive delivery environment.

IMPACT

Disrupts value-based prioritization and prevents capacity from being aligned to strategic product outcomes.

03

STAGES: Intake + Portfolio

GIS Informal PM Stack

"My team uses Jira for misc. work OneNote, Teams and Spreadsheets to manage" — George Porto

Delivery is managed through a mix of informal tools and processes, with limited portfolio visibility outside of large initiatives. A significant portion of work remains untracked

IMPACT

Limits end-to-end visibility and constrains effective product portfolio management and capacity planning.

04

STAGE: Classification

Corporate Project Overlap

"PDD is the driver. Lots of overlapping projects" — Amit Patel

Multiple tools and inconsistent classification approaches lead to duplicated demand and overlapping initiatives addressing similar outcomes. Coordination across teams is limited.

IMPACT

Reduces efficiency and prevents alignment to clear product ownership and business outcomes.

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

DELIVERY & EXPERIENCE PAIN POINTS (2/2)

Four critical bottlenecks are driving demand risk across the end-to-end Customer Services Applications lifecycle (intake to portfolio management)

CUSTOMER SERVICE APPLICATIONS

01

STAGES: Classification + Prioritization

Customer Services Leadership Gap

"Who is in charge of what — 3 people can run the payment jobs" — Kumar + Stephanie

Key leadership roles remain unfilled, with prioritization and decision-making cascading inconsistently across sub-teams. This results in limited alignment and no consolidated view of demand at the branch level.

IMPACT

Prevents consistent product-level prioritization and weakens accountability across the product portfolio.

02

STAGES: Portfolio + Delivery

No Branch-Wide Portfolio Tool

"No tool to support portfolio management... No tools or process to manage delivery of vendors"

Portfolio management capabilities are fragmented, with no unified view across Billing, CRM, Metering, and Basis. Existing tools support only isolated areas, limiting cross-team coordination. PMO handles large projects without a consolidated view of Billing / CRM / Metering / Basis portfolios.

IMPACT

Constrains end-to-end product portfolio visibility and limits the ability to manage capacity and priorities holistically.

03

STAGE: Delivery

Smart Metering Vendor Concentration

"All portfolio in vendor. Vendors are consultants for the work" — Iram Chowdhury

The Smart Metering portfolio is fully vendor-delivered, with vendors owning both requirements and execution. Internal capabilities to manage or challenge delivery are limited. "Intrinsic common sense" is the prioritization rule.

IMPACT

Weakens product ownership and creates dependency risks, limiting control over product outcomes and long-term capability

04

STAGE: Intake + Prioritization

Multi-OPCO Capacity Competition

"Resource allocation — multiple OPCOs competing by capacity" — Kumar

7 business OPCOs compete for the same Customer Services IT capacity. , with demand routed through parallel channels and no unified prioritization mechanism. Allocation decisions are often ad hoc

IMPACT

Prevents coordinated product planning and leads to suboptimal allocation of capacity across competing product demands.

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

STRUCTURAL MISALIGNMENT

Seven structural issues surface — no single-area fix resolves them; the TOM must standardize end-to-end

01 — No Product Entry Point

Demand enters through multiple disconnected channels, with no single front door aligned to products or value streams.

(6+ disconnected channels (Jira, IT Now, RITM, SharePoint, Email, Word). No single front door.)

→ Product model requires a **unified intake layer structured around products**, not tools or channels.

02 — No Value-Based Decisioning

Prioritization is inconsistent and driven by local criteria, with no common definition of value across initiatives.

(Each area uses different criteria — PDD, impact ×users, criticality, operational urgency, common sense.)

→ Product model requires a **standardized, value-based prioritization framework** tied to **business outcomes**.

03 — No End-to-End Product View

Portfolio management capabilities are fragmented, limiting visibility across demand, capacity, and delivery.

No consistent and standardized use of portfolio tool. Only Smart Metering uses PPM Now.

→ Product model requires **integrated portfolio tooling to manage products holistically** across their lifecycle.

04 — No Ownership of Outcomes

No standard process to manage delivery. Ownership is unclear across the lifecycle, with teams and vendors defining timelines and follow-up independently

(No standard process to manage delivery. Each team estimates, sets timelines, and follows up on delivery)

→ Product model requires **clear ownership, performance management, and outcome-based** governance.

05 — No Product-Level Steering

Existing forums are not structured to drive portfolio-level or product-based decisions.

(Different recurring forums exist — but Manager Check-in participants are still TBC; no forum covers portfolio-level decisions.)

→ Product model requires **governance aligned to product portfolios, with clear accountability** and decision rights.

06 — No Common Language of Value

Lack of standardized definitions of impact (client, business value) prevents consistent evaluation and comparison of work.

Each demand request is worked depending on perception of value and Demand size

→ Product model requires **a shared taxonomy and classification model** as a foundation for prioritization and planning.

07 — No Product Ownership Model

Work is organized around projects and applications, with limited alignment to value streams or business outcomes.

(Demand is organized by application silo, not by Value Stream. IT requests don't trace to business OKRs)

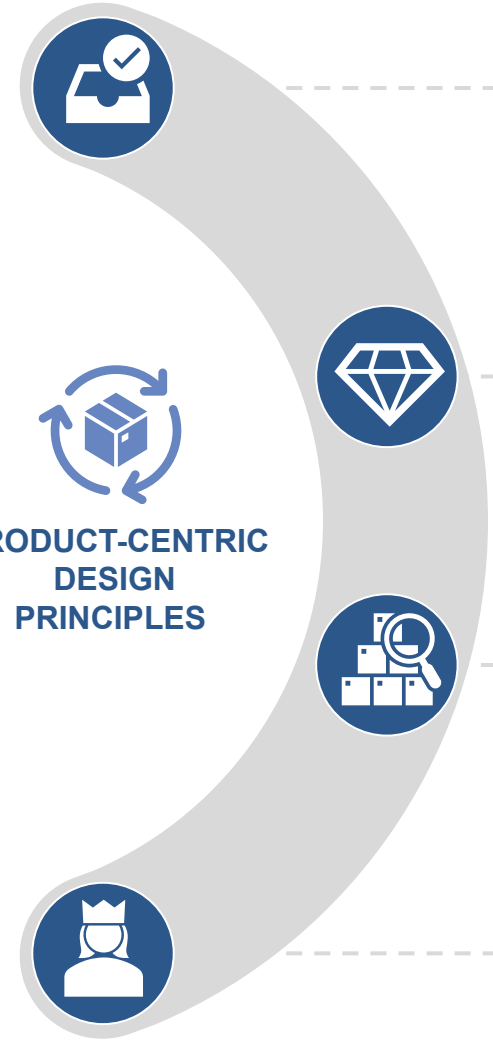

→ Product model requires **organizing around products, with clear ownership and alignment** to business OKRs.

INSIGHTS & KEY DEFINITIONS FOR THE TO-BE MODEL

TO-BE GUIDING PRINCIPLES

Four principles guide the Target Operating Model — each answers one of the 7 structural issues and is grounded in prior NTT work with Avangrid

PRODUCT-CENTRIC DESIGN PRINCIPLES

DEMAND INTAKE & STRUCTURING

All demand must be captured through a **unified intake layer aligned to products or value streams**, ensuring **full visibility and traceability**.

- **Single entry point** per product/value stream
- **Standard intake criteria and** mandatory fields
- **Consistent demand categorization** across teams (type, size, complexity, value driver)
- **Clear ownership** for triage and backlog assignment

VALUE-BASED PRIORITIZATION

Demand is consistently **evaluated and prioritized using a standardized framework** tied to **business outcomes**.

- **Common scoring model** (value, urgency, risk, effort)
- **Transparent prioritization** across competing demands
- **Product-level backlog** ownership
- **Trade-offs made at portfolio/product** governance level

PRODUCT PORTFOLIO MANAGEMENT & PLANNING

End-to-end visibility enables coordinated planning across demand, capacity, and delivery.

- **Integrated portfolio view** across all products
- **Capacity planning aligned to product priorities**
- **Roadmaps managed at product level** (not project level)
- **Continuous tracking of delivery and outcomes**

PRODUCT GOVERNANCE & OWNERSHIP

Clear **accountability and governance** ensure decisions are aligned to product outcomes.

- **Defined roles** (Product Owner / Product Manager / Tech Lead)
- **Product-based governance forums** with decision rights
- **Vendor management aligned to product** performance
- **KPIs tied to product outcomes and business value**
